## REPORT OF INDUSTRIAL VISIT - NSTL

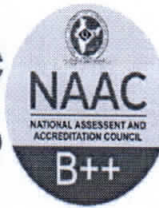

NSTL is involved in the design, development, testing, evaluation and product ionization of underwater weapons and their associated weapon control systems. In our visit we understand the different prototypes of torpedoes, mines, decoys, targets, simulators, Fire Control Systems and weapon launchers. (ATDS) is a torpedo detection and counter measure system used by the Indian navy The system offers a complete solution to detect and locate an incoming torpedoes and to apply counter measures to protect naval platform against torpedo attack. It is an anti-torpedo system with towed and expendable decoys. The system is capable of detecting, confusing, diverting and decoying the incoming torpedoes. The decoy helps in exhausting the energy of the torpedo by running the later through long and ineffective course and prevents them from homing in to the targeted platform with its advanced counter measures capabilities. An autonomous underwater vehicle (AUV) is a robot that travels underwater without requiring input from an operator. AUVs constitute part of a larger group of undersea systems known as unmanned underwater vehicles, a classification that includes non-autonomous remotely operated underwater vehicles (ROVs) – controlled and powered from the surface by an operator/pilot via an umbilical or using remote control. In military applications an AUV is more often referred to as an unmanned undersea vehicle (UUV). Underwater gliders are a subclass of AUVs.

Stealth technology, also termed low observable technology (LO technology), is a sub-discipline of military tactics and passive and active electronic countermeasures .Development of modern stealth technologies , where earlier attempts to prevent radar tracking of its U-2 spy planes during the Cold War by the Soviet Union had been unsuccessful. Designers turned to developing a specific shape for planes that tended to reduce detection by redirecting electromagnetic radiation waves from radars. Radiation-absorbent material was also tested and made to reduce or block radar signals that reflect off the surfaces of aircraft. Such changes to shape and surface composition comprise stealth technology as currently used on the Northrop Grumman B-2 Spirit "Stealth Bomber.

**OUTCOME :** Students have gained good knowledge on torpedoes & advanced technology that our defence system uses. They gained exposure to observable technology that will be using in wars.

### REPORT OF INDUSTRIAL VISIT - LSPH

Lower Sileru is a 460MW hydro power project. It is a reservoir based project. The net head of the project is 193.5m. The total number of penstocks, pipes or long channels that carry water down from the hydroelectric reservoir to the turbines inside the actual power station, are 2 in number. The project generated 1,050 GWh of electricity. All power projects included in this report are drawn from Global Data's Power Intelligence Centre. The information regarding the project parameters is sourced through secondary information sources such as electric utilities, equipment manufacturers, developers, project proponent's news, deals and financial reporting, regulatory body, associations, government planning reports and publications. Wherever needed the information is further validated through primary from various stakeholders across the power value chain and professionals from leading players within the power sector.

**OUTCOME :** Students have gained knowledge about the hydro power generation through which major share of electricity is supplied. They gained knowledge in different aspects of power generation schemes and this visit has given a good exposure to latest power schemes that our state use.
